## **Primary Mathematics Curriculum**

Data

|                          | <b>Stage 1</b><br>(Junior & Senior Infants)   | <b>Stage 2</b><br>(1st & 2nd Class)  | <b>Stage 3</b><br>(3rd & 4th Class)  | <b>Stage 4</b><br>(5th & 6th Class)   |  |
|--------------------------|---|--|--|---|--|
|                          | Through appropriately playful and engaging learning experiences, children should be able to                 |  |  |   |  |
| Learning<br>Outcomes     | explore, interpret and explain data in a variety of ways for a range of purposes.                           | pose questions of interest, record and use data<br>as evidence to answer those questions and<br>communicate the findings.                        | pose questions of interest and collect, display and<br>critically analyse data in a range of ways for a range<br>of purposes and communicate the findings.   | pose questions, collect, compare, summarise<br>and represent data selectively to answer those<br>questions.<br>critically analyse and evaluate findings; and                              |  |
|                          |   |  |  | implications from the findings.   |  |
| Mathematical<br>concepts | Data is all around us and helps us interpret the world.   | Investigations are cyclical and are motivated by posing a question.  | Data displays can hold a vast volume of information<br>which can be reasoned about and from which<br>decisions and inferences can be made.   | The mean, median and/ or mode are measures<br>of centre which communicate different middles<br>of the data and provide a range of insights.   |  |
|                          | A data set is a collection of information<br>that can provide answers to questions<br>we ask.               | Data investigations involve a process of collecting,<br>representing and analysing data, and communicating<br>conclusions that answer questions. | Data displays are selected and justified based on<br>their ability to communicate aspects of the data and<br>answer the questions posed. Moving between data<br>displays allows for further comparison and analysis. | Samples can be drawn from a population of<br>data as representative evidence, to make<br>generalisations and determine the degree of<br>confidence or certainty about the generalisation. |  |
|                          | Data can be collected and represented in many ways.   | Data can be qualitative (it describes something) or quantitative (it holds numerical value).   | Measures of centre (e.g., mean as the fair share, and<br>median as the middle-ordered value of the data) are<br>one-number summaries of entire distributions.  | Reported data can be evaluated in terms of its representativeness, intentionality and reliability.  |  |
|                          | Data can be collected and represented in many ways.   | Different types of data require different graphs and different statistical measures.   | The range is a measure used to capture variability or spread of the data.  | Data displays (e.g., graphs) can be used to<br>represent the variability in the data, the<br>measures of centre and to compare between<br>two groups.                                     |  |
|                          | Data displays (e.g., tables, picture<br>graphs, block graphs) are a useful way<br>of conveying information. | Graphs are tools which communicate distribution, shape, centre and variability of data.  | Secondary data can be analysed to make<br>observations or inferences and to draw logical<br>conclusions.   |   |  |
|                          | Objects and sets can be sorted according to one or more attributes.   |  | Informal inference is about moving beyond the data collected (sample) to a wider context (population).   |   |  |
|                          |   |  | Data can be distributed in different ways. Such distributions of data can be compared according to their shape.  |   |  |
