

Mathematical investigation: Chessboard Challenge

Learning outcomes in focus

Students should be able to:

U.4 represent a mathematical situation in a variety of different ways, including: numerically, algebraically, graphically, physically, in words; and to interpret, analyse, and compare such representations

U.7 make sense of a given problem, and if necessary, mathematise a situation

U.8 apply their knowledge and skills to solve a problem, including decomposing it into manageable parts and/or simplifying it using appropriate assumptions

U.9 interpret their solution to a problem in terms of the original question

U.11 generate general mathematical statements or conjectures based on specific instances

U.13 communicate mathematics effectively: justify their reasoning, interpret their results, explain their conclusions, and use the language and notation of mathematics to express mathematical ideas precisely

AF.1 investigate patterns and relationships (linear, quadratic, doubling and tripling) in number, spatial patterns and real-world phenomena involving change

AF.2 investigate situations in which letters stand for quantities that are variable

AF.3 apply the properties of arithmetic operations and factorisation to generate equivalent expressions

Learning intentions

We are learning to:

- break problems down into parts
- investigate and extend a pattern in a systematic way
- represent pattern in tables, charts and graphs
- look for patterns and make conjectures
- validate our conjectures
- generalise our observations
- use words, tables, graphs and letters to communicate and justify mathematical ideas clearly

Mathematical investigation: Chessboard Challenge

Teaching and learning context

First year students were in the middle of a unit of learning which focused on investigating patterns in a systematic way. This task was used to introduce quadratic sequences. Their task required them to calculate the number of squares on a chessboard. Students recorded their results in tables which helped them spot patterns. They were reminded to record their findings clearly, to make and validate conjectures, to look for patterns and to try to generalise patterns they observed. To start the lesson, students used placemats to brainstorm how they might tackle the problem. We then discussed some strategies as a class. The students worked in groups to solve the problem during a 40 minute class and worked independently to create their speech for homework.

Task

You are a member of the English Debate team and your team is opposed to the following motion.

'There are 64 squares on a chessboard.'

Prepare a speech where you convince your classmates that this statement is wrong. Use tables, charts or graphs to support your arguments. Ensure that you explain clearly how many squares you think there are on a chessboard, and how you arrived at this conclusion.

Extension

Can you find a formula for the number of squares on an $n \times n$ grid.

Success Criteria

I can

SC1 extend a given pattern in a systematic way

SC2 record my observations in a table

SC3 make and verify conjectures

SC4 translate between different representations of a pattern

SC5 draw conclusions from my mathematical ideas

SC6 communicate my ideas clearly in words, tables, graphs or generalised expressions

Mathematical investigation: Chessboard Challenge

Challenge: Some people say there are 64 squares on a chessboard (8x8 grid). But if you count up the 2x2, 3x3, 4x4, 5x5, 6x6, 7x7 and 8x8 squares, there are a lot more.
The challenge is to find out how many squares are on a chessboard

Prediction: I predict if you add up all the first 8 square numbers you will get the total number of squares. My prediction is there are ~~64~~ 204 squares.

Method:

Because it would take too long to count every square, start with a 2x2 square

1x1	4
2x2	1

Total: 5

Then do 3x3, 4x4, 5x5, 6x6, 7x7 and 8x8

3x3

1x1	9
2x2	4
3x3	1

Total: 14

1x1	16
2x2	9
3x3	4
4x4	1

Total: 30

4x4

SC3: Makes a conjecture

SC1: Extends a pattern in a systematic way

SC2: Records observations in a table

Mathematical investigation: Chessboard Challenge

1x1	64
2x2	49
3x3	36
4x4	25
5x5	16
6x6	9
7x7	4
8x8	1

If you add this, the total is 204 squares, my prediction was correct

Evaluation: In this investigation I used square numbers, multiplication and grids. My prediction was correct. The key skills I developed are communicating, being literate, being numerate and working with others.

SC3: Verifies conjecture

SC2: Records observations in a table

SC1: Extends a pattern in a systematic way

Extension Task: To solve how many squares are in a $n \times n$ grid just find that amount of square numbers then add them

eg. the first 10 square numbers are 1, 4, 9, 16, 25, 36, 49, 64, 81 and 100

Total = 385

Therefore there are 385 squares in a 10×10 grid. Now you can find out how many squares are in any amount of a grid. Formula:

$$n^2 + (n-1)^2 + (n-2)^2 + \dots + (n-n)^2$$

SC4: Translates between different representations of a pattern

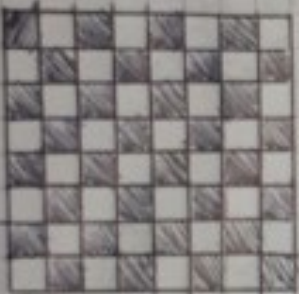

SC6: Communicates ideas clearly in words and generalised expressions although there are errors in the mathematics

Mathematical investigation: Chessboard Challenge

Debate: Some people say there are 64 squares on a chessboard, these people obviously aren't very mathematical because in fact there are 204 different squares on a chessboard, let me explain.

You have to count the 2×2 , 3×3 , 4×4 , 5×5 , 6×6 , 7×7 and 8×8 squares as well.

Here is a chessboard

As you can see there are 64 little squares and 1 big square but there are more.

2×2	1
1×1	4

In this 2×2 square there are 5 squares.

If you do this for 3×3 and 4×4 you will notice a pattern, in a 3×3 square there are the first 3 square numbers: 1, 4 and 9. If you keep this pattern going, an 8×8 would be

1×1	64
2×2	49
3×3	36
4×4	25
5×5	16
6×6	9
7×7	4
8×8	1

Total: 204 squares

As you can see there are 204 squares in an 8×8 grid.

SC6: communicates ideas clearly in words, tables or generalised expressions

SC4: Translates between different representations of a pattern

SC2: Records observations in a table

SC5: draws conclusions from mathematical ideas

Overall judgement:  Above expectations
